Faculty of Humanities and Social Science

A PROJECT REPORT ON

Volunteer Matching Platform

Submitted To

Department of Bachelor Application

Itahari Namuna College

*In partial fulfillment of the requirement for the degree of Bachelor's in Computer
Application*

Submitted By:

Shanti Rai

Under the supervision of:

Er.Chandra Prasad Acharya

Tribhuvan University Faculty of Humanities and Social Science Itahari Namuna College

SUPERVISOR'S RECOMMENDATION

I hereby recommend that this project prepared under my supervision by Shanti Rai entitled **“Volunteer Matching Platform”** in partial fulfillment of the requirements for the degree of Bachelor of Computer Application is recommended for the final evaluation.

SUPERVISOR

Er.Chandra Prasad Acharya

Project Supervisor

Itahari Namuna College

Itahari-8, Sunsari

Tribhuvan University Faculty of Humanities and Social Science Itahari Namuna College

LETTER OF APPROVAL

This is to certify that this project prepared by Shanti Rai entitled “**Volunteer Matching Platform**” in partial fulfillment of the requirements for the degree of Bachelor in Computer Application has been evaluated. In our opinion it is satisfactory in the scope and quality as a project for the required degree.

..... Er.Chandra Prasad Acharya, Lecturer BCA, Itahari Namuna College	 Nabin Shrestha, HOD BCA, Itahari Namuna College
..... Internal Examiner Itahari Namuna College	 External Examiner Tribhuvan University

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to everyone who contributed to the successful completion of this Volunteer Matching Platform project.

First and foremost, I would like to thank my project supervisor, Mr. Chandra Prasad Acharya, for his invaluable guidance, support, and encouragement throughout the development of this project. His expertise and advice have been a constant source of motivation

I am also thankful to Mr. Nabin Shrestha, Itahari Namuna College, and Mr. Dharma Neupane for their continuous encouragement and guidance throughout the completion of this project. Their valuable suggestions and cooperative behavior are sincerely acknowledged.

Last but not least, I am grateful to my professors and friends for their continuous support and assistance. Their insights, feedback, and encouragement helped me refine my ideas and improve the overall quality of this project.

ABSTRACT

The Volunteer Matching Platform (VMP) is a digital system designed to efficiently connect volunteers with organizations, automating key tasks and improving coordination. Volunteers can register, browse and apply for opportunities, track participation, download certificates, and make online donations. Organizations can create and manage opportunities, handle applications, communicate with volunteers, and issue certificates.

The platform ensures smooth management of volunteering activities and donation tracking, with features like real-time application processing, automated certificate generation, and secure online payments. This reduces manual work, minimizes errors, and enhances transparency.

By providing a centralized and user-friendly system, VMP improves engagement and collaboration between volunteers and organizations, making it easier to participate in social activities and community programs.

In essence, the Volunteer Matching Platform enhances volunteer coordination, strengthens organizational efficiency, and fosters community development.

Keywords: *Volunteer Opportunities, Online Donations, Certificate Management, Organization Management*

CHAPTER 1: INTRODUCTION

1.1 Introduction

As social challenges and community needs continue to grow, connecting willing volunteers with organizations in need of support has become increasingly important. Many organizations struggle to find reliable volunteers, while individuals who wish to contribute their time and skills often lack access to suitable opportunities. The absence of a centralized platform results in missed opportunities, poor coordination, and limited recognition for volunteer efforts.

In response to these challenges, this proposal introduces **Volunteer Matching Platform** a web-based volunteer matching platform designed to efficiently connect volunteers with organizations. The platform provides a user-friendly environment where organizations can create and manage volunteering opportunities, track volunteer participation, and mark opportunities as completed. Volunteers can easily browse and apply for opportunities that match their interests and skills, monitor their application status, and download participation certificates upon successful completion.

By streamlining communication and management between volunteers and organizations, the platform promotes active community engagement, transparency, and recognition of volunteer contributions.

1.2 Problem Statement

Volunteer engagement and coordination have become increasingly challenging due to the absence of a centralized digital platform. Many organizations face difficulties in reaching suitable volunteers, while interested individuals often struggle to find relevant and trustworthy volunteering opportunities. Poor communication, lack of transparency in application status, and absence of proper recognition for volunteer participation contribute to inefficient volunteer management.

a. Lack of Awareness of Available Opportunities

Many volunteers are unaware of volunteering opportunities that match their skills and interests due to scattered or informal information sources.

b. Inefficient Application and Tracking System

Organizations often manage volunteer applications manually, making it difficult to track volunteer participation, application status, and opportunity completion.

c. Absence of Recognition and Certification System

There is no standardized system to acknowledge volunteer contributions through verified certificates, which reduces motivation and credibility.

1.3 Objectives

- To create a transparent and user-friendly system that supports event management, volunteer tracking, and online donations to enhance social impact and community engagement.

1.4 Scope and Limitation

- i. Scope
 - To enhance and streamline the process of connecting volunteers with organizations.
 - To save time for both volunteers and organizations by automating opportunity posting, searching, and registration processes.
- ii. Limitation
 - Dependence on internet Connectivity
 - Risk of Data Loss
 - Operating Complexity

1.5 Development Methodology

I am using the Waterfall methodology for development of my Volunteer Matching Web Application. First, I gathered information about existing volunteer management systems to understand how organizations create opportunities and how volunteers apply for them. Based on this understanding, I researched and identified the required features and content to provide a simple and effective platform for users.

Figure 1: Waterfall Methodology

Choosing the best software development methodology for volunteer matching platform depends on several factors, such as a project's size complexity, timeline, team structure, and student's requirements. Hence, waterfall model seems to be the best method to implement this project. Below are the major steps we undertook while following waterfall development:

Requirement Analysis: In this phase, system requirements were collected and analyzed, including features such as user registration, opportunity posting, volunteer participation, dashboards, and online donation system.

Design: The system architecture, database schema, E-R diagram, and user interface designs were prepared to define how the platform would look and function.

Coding: The designed system was converted into working code using appropriate frontend and backend technologies. All modules were integrated to ensure smooth operation.

Implementation & Testing: The system was implemented and tested using different test cases to verify functionality, performance, and reliability.

Maintenance: Errors were fixed and improvements were made after testing to enhance system performance and security.

Documentation: Documentation was maintained throughout the development process to ensure proper record keeping and future reference.

CHAPTER 2: LITERATURE REVIEW

2.1 Background Study

An Online Volunteer Matching Platform is a digital system designed to connect volunteers with organizations and community-based initiatives efficiently. It provides a centralized platform where organizations can post volunteering opportunities and individuals can search, apply, and participate in social activities.

In Nepal, several organizations and platforms promote volunteerism and youth engagement. One such platform is Volunteer Nepal, which connects volunteers with social organizations and community projects across the country. It provides information about volunteering opportunities and focuses on youth participation and social development. However, it has limitations such as limited digital tracking of volunteer applications, lack of automated certificate generation, and mostly manual opportunity management. [1] Another example is Nepal Youth Foundation (NYF), a non-profit organization working in the areas of education, healthcare, and social welfare. It offers structured volunteer programs and has strong credibility and social impact. However, it lacks a centralized online volunteer management system, searchable opportunity listings, and modern web-based tracking tools. [2]

2.2 Literature Review

With the rapid growth of digital technology, online platforms have significantly transformed the way people engage in social activities and volunteer services. Modern web-based systems allow real-time communication, online registration, automated notifications, and digital record keeping, making volunteer coordination more efficient and transparent. [3]

Many international volunteer platforms provide features such as searchable opportunities, online application systems, participation tracking, digital certificates, and integrated donation systems. These platforms enhance user engagement and simplify administrative tasks for organizations. [4]

Study of Existing System

i. Volunteer Nepal: Volunteer Nepal is a platform that connects volunteers with social organizations and community-based projects across Nepal.

a) Features:

- Volunteer Nepal is a platform that connects volunteers with social organizations and community-based projects across Nepal.
- Allows volunteers to participate in social and community programs
- Focuses on youth engagement and social development

b) Limitation:

- Limited digital tracking of volunteer applications and participation
- No automated certificate generation system

ii. Nepal Youth Foundation (NYF): Nepal Youth Foundation is a non-profit organization that works with volunteers to support education, healthcare, and social welfare programs in Nepal.

a) Features:

- Structured volunteer programs
- Strong organizational impact and credibility
- Focus on long-term social development

b) Limitations:

- No centralized online system for volunteer application and tracking.
- Limited use of modern web-based management tools

CHAPTER 3: SYSTEM ANALYSIS AND DESIGN

3.1 System Analysis

3.1.1 Requirement Analysis

I) Functional Requirements

Figure 2: Use case Diagram of Volunify

This use case diagram represents the functionality of the Volunteer Matching Platform and the interactions between its two main actors: Volunteer and Organization. Volunteers can register or log in, view available volunteering opportunities, apply for events, send messages to organizations, download participation certificates, and make online donations. Organizations can register or log in, create and manage volunteering opportunities, handle volunteer applications, send messages to volunteers, issue participation certificates, and

track donations received. The platform also includes internal processes such as online payment processing, which supports the donation functionality.

II) Non-functional Requirements

- **Availability:** The platform is developed as a web application and can be easily accessed by volunteers and organizations from any device with an internet connection.
- **Performance:** The system is designed to provide smooth performance, ensuring fast loading of opportunities, applications, and donation processing without any noticeable lag.
- **Security:** Role-based access control is implemented to restrict features based on user type (Volunteer or Organization). Only authorized users can access sensitive data, such as volunteer applications, opportunity details, and donation records.
- **Reliability:** The platform ensures data consistency, preventing duplicate records of volunteering opportunities, applications, and donations, while maintaining accurate tracking of volunteer participation.

3.1.2 Feasibility Analysis

i. Technical

The platform is technically feasible, using React.js and JavaScript for the frontend, Node.js with Express.js for the backend, and Prisma ORM for database management. The system also includes online payment integration (Khalti) and PDF generation for certificates.

ii. Operational

The system runs over the internet, allowing volunteers and organizations to access it from anywhere. The application is designed for easy use and efficient management.

iii. Economical

Using open-source tools reduces costs. The budget is mainly used for development, testing, server hosting, and implementing key features like opportunity management and online donation.

iv. Schedule

The platform development is planned in three phases: planning and design (1–2 months), development and testing (3–4 months), and implementation with final testing and documentation (2–3 months).

iii. Process 5

Figure 9 : Level 2 DFD – Process 5

3.2 System Design

System design involves defining the key elements of the Volunteer Matching Platform, including its architecture, modules, components, interfaces, and data flow. It provides a structured approach to transform system requirements into a well-organized and functional application that meets the needs of volunteers and organizations.

This chapter focuses on the design of major modules such as volunteer management, organization management, opportunity management, application handling, and donation system. It also includes database design, user interface design, and overall program structure. Various diagrams, such as sequence diagrams and activity diagrams, are used to represent the system's workflow and interactions.

3.2.1 Database Schema Diagram

Figure 10 : Database Schema of Volunify

CHAPTER 4: IMPLEMENTATION AND TESTING

4.1 Implementation

4.1.1 Tools Used

i. Frontend

The frontend of this system is implemented using modern web technologies to provide a responsive and interactive user experience.

React.js:

React.js is a popular JavaScript library used for building user interfaces, especially single-page applications. It enables the development of reusable components and efficient rendering using a virtual DOM. In this project, React is used to create a dynamic and modular frontend, such as the role-based login system.

Tailwind CSS:

Tailwind CSS is a utility-first CSS framework used for designing responsive and visually appealing user interfaces. In this project, Tailwind CSS is used to enhance the UI with modern design features like gradients, flexbox layouts, and responsive components.

JavaScript:

JavaScript is used as the core scripting language for frontend development. It enables interactivity, event handling, form validation, and communication with the backend through APIs. In this project, JavaScript is used along with React to manage application state and user interactions.

React Router:

React Router is used for navigation between different pages in the application. It allows seamless routing without reloading the page, improving user experience.

Lucide React:

Lucide React is an icon library used to incorporate modern and customizable icons in the user interface, enhancing visual appeal and usability.

ii. Backend and Database

The backend is developed using PHP, and the database is managed using MySQL.

Node.js (Express.js):

Node.js is a server-side JavaScript runtime used to build scalable and efficient web applications. Express.js is used as a framework to handle routing, APIs, and server logic. In this project, Node.js is used to manage business logic, process user requests, handle authentication, and implement features such as opportunity management, certificate generation, and donation handling.

Prisma (ORM):

Prisma is an open-source Object Relational Mapping (ORM) tool used to interact with the database efficiently. It simplifies database operations such as querying, inserting, updating, and deleting data. In this project, Prisma is used to manage data related to users, opportunities, applications, and certificates.

Various software tools have been utilized throughout development process, including:

- Microsoft Word: For documentation purposes.
- Visual Studio Code: As an integrated development environment (IDE) for coding.
- GitHub: Used for version control and collaboration.
- Web Browser (Chrome): Used for running and testing the application.
- Postman: Used for testing API endpoints such as login functionality.
- Draw.io: Used for creating system diagrams like DFD and ER diagrams.

4.1.2 Implementation Details of Modules

The system is developed using an incremental approach, which allows flexibility and continuous improvement. Users can review the system during development, and necessary changes can be easily implemented.

The main modules of the Volunteer Matching Platform are as follows:

Authentication Module:

This module handles user registration and login for both volunteers and organizations. Users must provide valid details to access the platform securely.

Profile Module:

This module manages user information, profile updates, and password changes. It ensures data security and allows users to customize their profiles.

Volunteer Module:

This module allows volunteers to view opportunities, apply for events, send messages, download certificates, and make donations.

Organization Module:

This module enables organizations to create and manage opportunities, handle volunteer applications, communicate with volunteers, issue certificates, and view donations.

4.2 Testing

4.2.1 Test Cases for Unit Testing

Unit testing is a software development practice that involves examining the smallest functional components of an application individually and independently to ensure they operate correctly. The primary goal of unit testing is to isolate specific sections of code and verify that they function as intended.

Table 1: Test Case for Unit Testing

TC ID	Test Case	Description	Expected Result	Status
1	Volunteer Login (Valid)	Enter correct credentials	Login successful	Pass
2	Volunteer Login (Invalid)	Enter wrong credentials	Error message shown	Fail
3	Organization Login (Valid)	Enter correct credentials	Login successful	Pass
4	Organization Login (Invalid)	Enter wrong credentials	Error message shown	Fail
5	Logout	Click logout button	Redirect to login page	Pass

4.2.2 Test Cases for System Testing

System testing for the Volunteer Matching Platform ensures that all functionalities work correctly according to user requirements and performance standards. It includes testing user authentication, opportunity creation and management, volunteer application processes, certificate generation, donation handling, and database management.

Table 2: Test Case for System Testing

TC ID	Test Case	Description	Expected Result	Status
1	User Registration & Login	User registers and logs in	Login successful	Pass
2	View Opportunities	Volunteer views available opportunities	Opportunities displayed	Pass
3	Apply for Opportunity	Volunteer applies	Application sent to organization	Pass
4	Manage Applications	Organization accepts/rejects	Status updated correctly	Pass
5	Certificate Download	Volunteer downloads certificate	Certificate downloaded	Pass

CHAPTER 5: CONCLUSION AND FUTURE WORK

5.1 Conclusion

The Volunteer Matching Platform is a responsive web application designed to connect volunteers with organizations and manage volunteering activities efficiently. The system integrates key functionalities such as opportunity posting, application handling, communication, certificate generation, and online donation.

Developed with the aim of improving volunteer coordination, this project simplifies the process for both volunteers and organizations. It was built using the knowledge gained throughout the semester with guidance from the supervisor and instructors.

All the objectives of the project have been successfully achieved. The platform effectively manages volunteer participation, opportunities, and donations while providing a user-friendly experience.

5.2 Outcome

The final outcome of the project aligns with its initial design. The system successfully functions as a digital Volunteer Matching Platform, allowing volunteers to find and join opportunities while enabling organizations to manage events and participants.

The platform provides features such as opportunity management, application tracking, certificate issuance, and donation handling. It ensures smooth interaction between volunteers and organizations and improves overall efficiency in managing social activities.

5.3 Future Recommendations

Although the project meets the requirements of the Tribhuvan University curriculum, the following improvements can enhance the system further:

- **Notifications System:** Send alerts for new opportunities, application status, and upcoming events.
- **Two-Factor Authentication (2FA):** Improve security with additional verification.
- **Chat System:** Enable real-time communication between volunteers and organizations.
- **Auto-Generated Reports:** Provide insights into participation, donations, and platform usage.
- **Mobile Application:** Develop a mobile version for better accessibility.
